Features Completed:
- Website Layout
  - Overall Layout of the website is completed with all the needed pages
  - Currently only framework done, no content has been inserted
  - About us page is complete, with pictures and short bios
  - Style Page completed for website
  - Main problem is that it is sometimes hard to format, especially formatting code
- Navigation Bar
  - Navigation bar is completed. It consists of links to the home page, about us, and all the content pages.
  - This is working smoothly, though the dropdown menu drops down and moves all the content on the page
- Login Page/Database
  - Currently have a login page that allows users to create a username and password which is then added to the database
  - Currently will allow user to log in if username/password match one already in the database
- Feedback Channel
  - Has a text box and a submit comment button
  - Posting works, need to format it to make it look nicer
  - Need to use database to store comments so refreshing the page doesn't delete them
  - Also should not allow empty posts

Issues:
- Our primary issues came from a few bugs with the login page, there was a small issue with sometimes the account not logging in despite there being a matching username
- We also had a few issues in the initial attempts to join the separate components as we first need to get them all to match up

TA Suggestions:
- Integrate all the components together sooner rather than
- Look at the files provided in labs as an example for formatting and any other needs for such examples of implementing code on the website
